### **Thoughts on Bubble**

I can see many pros and cons with using a system like Bubble. Bubble allows people to make websites without ever having to think about writing their own code. Right away this makes web development accessible to a much larger range of people than it would be otherwise. Bubble also allows you to make websites much quicker than if you were going to code them yourself, as it has many common modules and UI elements prebuilt for you like image sliders. However, as with all systems that remove the programming aspect, you lose a lot of control over the project.

When designing things from scratch, the sky is the limit. When using these systems, your limits are set by them as well. I can also see issues arising if a user wanted to create a more interactive, game-like experience. Overall, I think Bubble is a great tool for people who want to make their own web apps, but don't like the idea of programming. After going through the tutorials, I was very impressed with how far these codeless systems have progressed since I've last seen them as well.

### **Class Project**

When it comes to the class project, I think I am mostly interested in learning about geolocation and programming for VR/AR experiences. I am also interested in exploring UI/UX design in an app like this. Overall I am very flexible and willing to work on whatever part of the app needs the most help.
